

SKILLSYNC · BUILD GUIDE · AUGUST 2026

How we built an AI education company with ₹0 overhead

Every system we shipped, every tool we chose, and exactly why — written for both the non-technical reader and the engineer. One founder, a relay of AI agents, and a budget of nothing.

Live at **infra-sync.online** · Repository: `infrasync-marketing-os` · Everything in this document is running in production or verified in test mode.

1 · The one-page story

SkillSync sells live AI education: a 2-Day AI Workshop (₹1,999 India / \$20 international) that leads into two cohort programs — the **AI Generalist Accelerator** (for non-tech people) and the **AI Engineer Accelerator** (Python required), both ₹95,000 / \$1,200 with no-cost EMI.

The rule we never broke: **overhead stays at ₹0–100/month**. Anything that costs money per sale (payment fees, call minutes) is a cost of goods — allowed. Anything that costs money just to exist — replaced with a free tier, open source, or something we built.

The second rule: **one person, many AI agents**. Expensive AI (Claude) architects, reviews, and unblocks. Cheap or free AI (Kimi K3 at night, Gemini/Nemotron by day) does the long typing. The repository itself is the shared memory — every agent reads the same files, logs evidence for every claim, and any new model can onboard from the repo alone.

2 · What exists today

System	What it does	Status
Website (16 pages)	Programs, pricing, quiz, policies, chat agent, public certificate verification	Live on infra-sync.online
Payments	Hosted Razorpay pages for all 3 products, linked from every buy button	Live (test mode until KYC)
Delivery pipeline	Payment → certificate → content access → CRM → email, automatically, by 8 PM	Proven end-to-end
Certificates	Unique SSC-numbered PDFs, publicly verifiable at /verify	Live
CRM	Contacts & pipeline in HubSpot; payers auto-created	Live
Voice counselor	Answers program questions by phone-style web call, collects lead details	Live (dedicated account)
Reminder agent	Outbound confirmation/reminder caller (xAI)	Built, parked until telephony
Chat agent	On-site widget answering only from the business facts file	Live
Community page	WhatsApp community funnel with full registration form	In design preview
Analytics & errors	Every visit and crash recorded	Live

3 · The tools, and why each one won

Cloudflare (website hosting + domain) ₹0

The site runs on Cloudflare's global network, and our domain's DNS lives there too — one dashboard for both. When we push code to GitHub, Cloudflare rebuilds and redeploys the site automatically, worldwide, in about three minutes.

Tech: Next.js 15 on Cloudflare Workers via OpenNext (git-connected Workers Builds; root *storefront/*). Branch pushes get preview URLs — design work ships on *design-v3* and is reviewed on a preview before merging to main.
Why not Vercel: its free Hobby tier prohibits commercial use; Cloudflare's doesn't.

Next.js (the website itself) ₹0 · open source

One codebase produces every page, the quiz, the chat API, and the certificate verification page. It pre-renders pages so they load fast anywhere.

Tech: App Router, 16 routes, mix of static and server-rendered; framer-motion springs + a React Three Fiber 3D hero; design tokens in CSS variables (cream/ink/hyper-blue, Instrument Sans — direction measured from auxia.io).

Supabase (the database) ₹0 free tier

One place stores subscribers, quiz results, registrations, and every certificate ever issued. The public verify page reads from it; the delivery pipeline writes to it.

Tech: Managed Postgres (Mumbai region) with REST + RLS; service-role key server-side only. **Why not Pinecone/extra vendors:** pgvector covers embeddings later — one vendor fewer.

Razorpay (payments) fees are per-sale = COGS

Buy buttons link to Razorpay-hosted payment pages — they handle cards, UPI, netbanking, and no-cost EMI. Every payment records the student's name, email, and phone.

Tech: Hosted Payment Pages (zero PCI scope, zero API needed to sell). Test mode until KYC completes, then the same pages flip live. **Why not Stripe:** no India signup for individuals; a Singapore workaround would have violated ToS/KYC.

Brevo (email) ₹0 · 300 emails/day

Certificates and delivery packs arrive from **team@infra-sync.online** — our own domain, authenticated so Gmail and Yahoo trust it.

Tech: SMTP relay + domain authentication (DKIM ×2, DMARC, brevo-code TXT in Cloudflare DNS). Sender passes Google/Yahoo 2024+ bulk-sender rules.

Google Drive + a robot account (content delivery) ₹0

Session recordings and notes live in Drive. A "service account" — a robot teammate — grants each paying student access **to their registered email only**. No public links to leak.

Tech: GCP service account, Drive API, RS256-signed JWT (no SDK — ~80 lines of Node crypto). Per-session-date folders created automatically; permission grants are idempotent.

HubSpot Free (CRM) ₹0 forever tier

Sales sees every lead and payer in a familiar tool. The pipeline creates/updates contacts automatically when someone pays; humans add call outcomes.

Tech: Service-key token, contacts read/write scope only. Custom properties: Program (dropdown), Enrollment Status. **Why not self-hosted Twenty:** Docker on a laptop can't be demoed anywhere; Twenty is queued for the future VPS.

OmniDimension (voice counselor) web calls ≈ ₹0

A phone-style agent answers program questions in English or Hindi, applies our claims policy, and emails us each caller's details and interest.

Tech: Dedicated account (isolated from other projects); gpt-4.1-mini; knowledge base = a PDF exported from the business-facts file, so it cannot invent prices.

The delivery machine (our own code) ₹0

The heart of the company. Every evening it can run once and fulfil every new student automatically — the exact flow a competitor does with staff:

```
Razorpay payments → registrations table → participation certificate (SSC-####) → Drive access  
(their email only) → HubSpot contact → pack email by 8 PM — idempotent · re-runs never double-  
send
```

Tech: ~300-line Node script (*scripts/delivery-pack.mjs*), stamps per-stage timestamps in Supabase; GitHub Actions cron (20:30 IST) ready to activate with repo secrets; certificates rendered by Playwright to PDF/PNG.

Free AI, three layers deep ₹0

The site's chat agent answers from a chain of free AI providers — if one is busy, the next answers. Separately, the build itself was done by a relay of AI agents.

Tech: /api/chat falls back Groq → Gemini Flash → NVIDIA NIM. Build relay: Claude (architecture/review/unblocking), Antigravity Opus/Gemini (day shifts), Kimi K3 (night shifts), Nemotron via local LiteLLM proxy. The repo is the shared memory: START-HERE.md onboards any model; BUILD-LOG.md records evidence for every claim.

PostHog + Sentry (measurement) ₹0 free tiers

PostHog records what visitors do (pageviews, quiz completions, checkout clicks). Sentry catches every crash in real time. You can't improve what you can't see.

4 · The honesty layer (why some things look different on purpose)

Education advertising is regulated (ASCI in India, FTC in the US). We wrote a claims policy into the repository, and every agent obeys it:

- **Reviews are labeled "illustrative"** until real, consented student reviews exist. The section looks complete for the demo and stays legally defensible.
- **Participation ≠ completion.** Registrants get a *participation* certificate; *completion* certificates are earned by finishing an accelerator. Both verify publicly.
- **No invented outcomes.** No "10x salary", no fake learner counts, no fabricated mentor bios, no fake scarcity. Structure borrowed from the best pages; claims kept honest.
- **Consent everywhere.** Reminder calls/messages only to registrants who opted in; a human triggers every outbound batch.

5 · What it costs

Item	Monthly cost	Notes
Hosting, database, email, CRM, analytics, errors, AI chat	₹0	Free tiers, deliberately chosen
Domain (infra-sync.online)	≈ ₹0 (yearly)	Renewal decision Mar 2027
Payment fees	% per sale	COGS, not overhead
Voice/call minutes, WhatsApp utility messages	per use	COGS, activates post-revenue
Total fixed overhead	₹0	The rule, kept

6 · What's next

- **Razorpay KYC → live mode** (free, background) — flip the same pages to real money.
- **GitHub Actions secrets** — the 8:30 PM delivery run goes fully hands-free in the cloud.
- **WhatsApp Cloud API** — official-only, for reminders and the community.
- **Telephony for the reminder agent** — once revenue makes ₹1–2/min a sensible COGS.
- **Growth engines** — competitor research, SEO content, Google Flow video ads.

Sources of truth in the repository: agent/offers.md (business facts) · BUILD-LOG.md (evidence log) · knowledge/decisions.md (every choice & rejected alternative) · prompts/START-HERE.md (how any AI agent onboards). Generated 26 Aug 2026.
